There is considerable world-wide interest in the remote sensing of chlorofluorocarbons (CFCs), especially CFC-11 ( $\text{CFCl}_3$ ) and CFC-12 ( $\text{CF}_2\text{Cl}_2$ ); hydrochlorofluorocarbons (HCFCs), HCFC-22 ( $\text{CHFCl}_2$ ) in particular; the fluorocarbon  $\text{CF}_4$ ; the chlorocarbon  $\text{CCl}_4$ ; and sulphur hexafluoride ( $\text{SF}_6$ ). Laboratory measurements of the spectral absorption cross-sections are needed for the retrieval of the atmospheric vertical mixing ratios and column abundances of these molecules from observational data.

These molecules exhibit infrared absorption features that do not lend themselves readily to the conventional line-by-line analysis that is suitable for the spectra of  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{N}_2\text{O}$ , and  $\text{CH}_4$ . Therefore, our laboratory has developed a novel technique of measuring the absorption cross-section,  $k_\nu$  ( $\text{cm}^2$  molecule $^{-1}$ ), which is defined as  $k_\nu = (-\ln \tau_\nu)/p\xi L$  in terms of the spectral transmittance  $\tau_\nu$  at the wavenumber  $\nu$ , temperature  $T$ , and total pressure  $p$  along an optical path of length  $L$  through the absorbing chemical with a mixing ratio of  $\xi$  in  $\text{N}_2$  (used in place of air without any measurable difference in the measured  $k_\nu$ ) directly.

At previous Science Team meetings, we have reported highly accurate  $k_\nu$  in the thermal infrared bands of CFC-11 ( $\text{CFCl}_3$ ), CFC-12 ( $\text{CF}_2\text{Cl}_2$ ), HCFC-22 ( $\text{CHFCl}_2$ ) and  $\text{SF}_6$  at several ( $T, p$ ) combinations representing atmospheric layers. We present now the significant enhancement that we have produced in the database on cross-sections by extending our earlier measurements to include additional chemicals such as  $\text{CF}_4$  (CFC-14) and  $\text{CCl}_4$  (Figures 1 and 2) and to conditions encountered in the atmosphere at Arctic and Antarctic latitudes.

**Figure 1.** Spectral absorption cross-sections of  $\text{CF}_4$  between 1281 and 1284  $\text{cm}^{-1}$ . The experimental conditions correspond to the surface, 5-km, and 19-km levels of the U.S. Standard Atmosphere.

**Figure 2.** Spectral absorption cross-sections of  $\text{CCl}_4$  between 755 and 810  $\text{cm}^{-1}$ . The experimental conditions correspond to the surface, 5-km, and 19-km levels of the U.S. Standard Atmosphere.
