ARM Climate Research Facility Monthly Instrument Report

JW Voyles

September 2010

DISCLAIMER

This report was prepared as an account of work sponsored by the U.S. Government. Neither the United States nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the U.S. Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the U.S. Government or any agency thereof.

ARM Climate Research Facility Monthly Instrument Report

JW Voyles

September 2010

Work supported by the U.S. Department of Energy,
Office of Science, Office of Biological and Environmental Research

Abstract

The purpose of this report is to provide a concise but comprehensive overview of Atmospheric Radiation Measurement Climate Research Facility instrumentation status. The report is divided into the following five sections: (1) new instrumentation in the process of being acquired and deployed, (2) field campaigns, (3) existing instrumentation and progress on improvements or upgrades, (4) proposed future instrumentation, and (5) Small Business Innovation Research instrument development. [New information is highlighted in blue text.](#)

Acknowledgments

This report is developed largely from the information submitted to and managed within our Instrument Mentor Monthly Summary (IMMS) reporting system (<http://www.db.arm.gov/IMMS/>). Special thanks to our instrument team for providing timely and complete updates to the IMMS, to Kathy Doty, our developer and administrator of IMMS, and Dana Dupont and Rolanda Jundt, who ensure that this information is posted accurately on the ARM website.

1.0 New Instrumentation

This section describes approved new instrument deployment and upgrade activities for the current fiscal year (FY).

1.1 ARM Initiative—Recovery Act Instrumentation

Through the American Recovery and Reinvestment Act of 2009, the U.S. Department of Energy's Office of Science received \$1.2 billion. In late May 2009, DOE released approximately \$54 million—90 percent—of the \$60 million allocated to the ARM Climate Research Facility. The remaining 10 percent of the Recovery Act funds (\$6 million) was released in August. During the next 18 months, ARM will purchase and deploy dual-frequency scanning cloud radars to all ARM sites, enhance several sites with precipitation radars and energy flux measurement capabilities, and invest in new aerosol sampling and aerial instrumentation. This is just a small sample of the planned enhancements that will result in 143 new instruments for the ARM user community. Please visit the ARM Recovery Act web page for updates: <http://www.arm.gov/about/recovery-act>.

Contact Jimmy Voyles at jimmy.voyles@pnl.gov for specific details related to Recovery Act tasks.

2.0 Field Campaigns

Contact: Jimmy Voyles, ARM Instrument and Field Campaign Coordinator

This section provides information for ARM field campaigns that have a significant impact on instrumentation and instrument team resources. Please refer to the ARM field campaign web page at <http://www.arm.gov/campaigns> for approved activities.

FY2010–2011

ARM AMF1 – Azores: Clouds, Aerosol and Precipitation in the Marine Boundary Layer (CAP-MBL). Scientists will take advantage of the ARM Mobile Facility (AMF1)—a heavily instrumented portable atmospheric laboratory—to study low marine clouds and aerosols in the Azores. Led by Robert Wood from the University of Washington, the new award extends the original 9-month project duration on Graciosa Island from March 2009 to November 2010. Doubling the length of the deployment will provide significantly greater statistical reliability of the relationships between aerosol and cloud properties required for evaluation of climate and process models.

ARM – Alaska: Arctic Lower-Troposphere Observed Structure (ALTOS). This 2-month campaign in 2010 will focus on the fall transition season, when sea ice begins to form and dramatic changes in aerosol and cloud properties occur. Led by Johannes Verlinde from The Pennsylvania State University, the science team will use a heavily instrumented tethered balloon to make routine ascents and descents in the lower 2 km of the atmosphere at Oliktok Point, Alaska. Supplemented with measurements from an instrumented ground station, this campaign will be the first to capture a full atmospheric profile of in situ

cloud microphysics, aerosols, and radiative measurements during the Arctic transition season. The unique data set will provide a thorough case for testing Arctic cloud processes used in climate models and for testing the algorithms used to retrieve these measurements.

ARM AMF2 – Colorado: Storm Peak Lab Cloud Property Validation Experiment (STORMVEX).

Jay Mace is also the lead scientist for the study of liquid and mixed-phase clouds at the Storm Peak Laboratory near Steamboat Springs, Colorado. This campaign will debut the user facility's second mobile unit (AMF2), which is currently under development. It will be deployed from approximately October 2010 through March 2011 at a location near the laboratory, which operates at an elevation of 3210 m above sea level. The close proximity of the mobile facility and the laboratory's instrument platform is expected to result in a correlative data set equivalent to between 200 and 300 aircraft flights in liquid and mixed-phase clouds.

FY2011–2012

ARM AMF1 and AAF G-1 Aircraft – India: Ganges Valley Aerosol Experiment (GVAX). AMF1 and the G-1 aircraft will support the Ganges Valley Aerosol Experiment to study the impact of increasing aerosols on the Indian summer monsoon, specifically the impact on precipitation. Many in-country collaborators will provide valuable complementary measurements.

ARM TWP – Manus: ARM Madden-Julian Oscillation (MJO) Investigation Experiment (AMIE).

A major campaign at the Manus site (ARM Tropical Western Pacific site), the ARM Madden-Julian Oscillation (MJO) Investigation Experiment, will be coordinated with a large international MJO initiation field campaign called CINDY2011 (Cooperative Indian Ocean experiment on intraseasonal variability in the Year 2011). The mechanism and cause of the MJO, an equatorial traveling pattern of anomalous rainfall that is planetary in scale, is not well understood and has the distinction of not being accurately simulated in any current model.

ARM SGP – Oklahoma: Midlatitude Continental Convective Clouds Experiment (MC3E). The Midlatitude Continental Convective Clouds Experiment will be a joint campaign with the NASA Global Precipitation Measurement Project. This experiment, conducted at the ARM Southern Great Plains site, will study cloud and precipitation transitions and environmental quantities that are important for convective parameterization in large-scale models and cloud-resolving model simulations. The location of the experiment will be centered on the SGP Central Facility to take advantage of the new radars that will have just been installed.

FY2012–2013

ARM AMF2 – ARM MJO Investigation Experiment on Gan Island (AMIE-Gan). The overarching campaign, which includes the AMF2 deployment in conjunction with the DYNAMO and CINDY2011 campaigns, is designed to test several current hypotheses regarding the mechanisms responsible for MJO (Madden-Julian Oscillation) initiation and propagation in the Indian Ocean area. The synergy between the proposed AMF2 deployment with DYNAMO (Dynamics of the MJO)/CINDY2011 and the corresponding funded experiment on Manus combine for an overarching ARM MJO Investigation Experiment (AMIE) with two components: AMF2 on Gan Island in the Indian Ocean (AMIE-Gan), where the MJO initiates and starts its eastward propagation, and the ARM Manus site (AMIE-Manus), is in the general area where the MJO usually starts to weaken in climate models. AMIE-Gan will provide

measurements of particular interest to Atmospheric System Research (ASR) researchers that are relevant to improving the representation of MJO initiation in climate models. The framework of DYNAMO/CINDY2011 includes two proposed island-based sites and two ship-based locations, forming a square pattern with sonde profiles and scanning precipitation and cloud radars at both island and ship sites. These data will be used to produce a variational analysis data set coinciding with the one produced for AMIE-Manus. The synergy between AMIE-Manus and AMIE-Gan will allow studies of the initiation, propagation, and evolution of the convective cloud population within the framework of the MJO. As with AMIE-Manus, AMIE-Gan/DYNAMO also includes a significant modeling component geared toward improving the representation of MJO initiation and propagation in climate and forecast models.

3.0 Existing Instrumentation

This section describes activities that are ongoing to improve the performance of or maintain existing instrumentation, including any planned or in-progress upgrades. The information is abstracted primarily from the Instrument Mentor Monthly Summary (IMMS) reports database (<http://www.db.arm.gov/IMMS/>), which can be used for a collective and historical view of instrument status. Individual IMMS reports may be reviewed by following links to specific instruments from instrument web pages (<http://www.arm.gov/instruments>). ARM Mentors provide updates to the IMMS under these categories:

1. Data Review
2. Instrument Performance Issues and Trends
3. Current Task Status
4. Near-Term Plans
5. Accomplishments.

Information related to the progress and status of instrument engineering is available from the Engineering Change Order (ECO) database (<http://eco.arm.gov>).

Helpful links to instrument-related ARM web pages are listed below:

- Data Quality Program, <http://dq.arm.gov/>

3.1 Aerosol Measurements

Aerosol Observing System (AOS)

Mentor: Anne Jefferson, NOAA/ESRL/Global Monitoring Division (GMD)

There are no open engineering tasks related to the AOS instrument suite.

Tandem Differential Mobility Analyzer (TDMA)

Mentor: Don Collins, Texas A&M University

Engineering Change Request ECO-00587, *Develop Collection and Ingest for TDMA*. Data from the TDMA currently are acquired and processed by Don Collins. Processed data are then delivered to ARM on a monthly basis and stored in the IOP area of the ARM Data Archive as “beta data.” An ingest is being developed to produce netCDF files for inclusion in the main Data Archive. The communications group is contacting Don Collins to develop a web area, enter instrument metadata, and edit the instrument handbook. The TDMA needs to have an entry added to the IMMS reporting system. Data are available at the Data Archive, and a draft of the instrument handbook has been delivered (<http://www.arm.gov/instruments/tdma>). This ECO will remain open until the instrument mentor and software developer work out the remaining data product and data delivery pattern issues.

3.2 Atmospheric State

Balloon-Borne Sounding System (BBSS)

Mentor: Rich Coulter (with Mike Ritsche and Donna Holdridge), Argonne National Laboratory

Engineering Change Request ECO-00769, *Add Cryogenic Frostpoint Hygrometer Launches at the SGP in support of GRUAN*, is approved. Mike Ritsche is the lead. The Global Climate Observing System (GCOS) Reference Upper Air Network (GRUAN) is an international reference-observing network, designed to meet climate requirements and to fill a major void in the current global observing system. Upper air observations within the GRUAN network will provide long-term high-quality climate records, will be used to constrain and validate data from space-based remote sensors, and will provide accurate data for the study of atmospheric processes. GRUAN has been identified by the climate community as being required to generate long-term high-quality climate records, to constrain and calibrate data from more spatially comprehensive global observing systems (including satellites and current radiosonde networks), and to fully characterize the properties of the atmospheric column. The GRUAN requirement is to provide one cryogenic frostbite hygrometer (CFH) sounding per month. ARM is working with NOAA and the GRUAN Lead Center to establish support for the launches at the SGP by providing base stations, supplies, balloons, gases, cryogenics, and storage containers for cryogenics, calibration supplies, and CFH sondes to obtain water vapor profile measurements into the lower stratosphere once per month.

Engineering Change Request ECR-00694, *Characterize the Temperature Dependency of the RH Sensor in the SurTHRef System*, is under review. Mike Ritsche is the leader. The goal, if initial analysis and review show promise, are to improve the initial conditions (T, RH) of the RS-92 sondes at launch time

while providing National Institute of Standards and Technology (NIST) tractability of sensor calibrations. This request is on hold until further analysis and results of the technique are available.

SuomiNet Global Positioning System (SuomiNet)

Mentor: None (external data provided by SuomiNet/COSMIC). Rick Wagener, Brookhaven National Laboratory, is the infrastructure contact.

Please see <http://www.unidata.ucar.edu/data/suominet/> and <http://www.arm.gov/data/vaps/suomigps> for the details on the SUOMIGPS data.

3.3 Carbon Measurements

Carbon Dioxide Flux System (CO₂FLX)

Mentor: Marc Fischer, Lawrence Berkeley National Laboratory

There are no open engineering tasks related to the Carbon Dioxide Flux System (CO₂FLX) instrument suite.

Carbon Monoxide (CO) System

Mentor: Sebastien Biraud, Lawrence Berkeley National Laboratory

There are no open engineering tasks related to the Carbon Monoxide (CO) instrument suite.

Precision Carbon Dioxide Mixing Ratio System (PGS)

Mentor: Sebastien Biraud, Lawrence Berkeley National Laboratory

There are no open engineering tasks related to the Precision Carbon Dioxide Mixing Ratio System (PGS) instrument suite.

3.4 Lidars

Micropulse Lidar (MPL)

Mentor: Rich Coulter, Argonne National Laboratory

Engineering Change Order ECO-00698, *Update MPLs to Fast Switching Polarization*, submitted by Rich Coulter, is approved. The ECO will upgrade each of ARM's MPLs to add fast-switching polarization. The plan is in process to have Sigma Space modify all six installed MPL systems.

Raman Lidar (RL)

Mentor: Rob Newsom, Pacific Northwest National Laboratory

There are no open engineering tasks related to the Raman Lidar (RL) instrument suite.

Vaisala Ceilometer (VCEIL)

Mentor: Vic Morris, Pacific Northwest National Laboratory

There are no open engineering tasks related to the Vaisala Ceilometer (VCEIL) instrument suite.

3.5 Meteorology

Surface Meteorological Instrumentation

Mentor: Mike Ritsche, Argonne National Laboratory (SMET, SMOS, SURTHREF, THWAPS, MET, METTWR [NSA Site])

Engineering Change Request ECR-00672, *Upgrade Dynamic Rain Gauge Calibration System*, is approved. This task is in process to improve the characterization and performance of ARM's precipitation measurements. Component evaluation and testing continues.

Tower – Meteorological Tower Systems (TWR)

Mentor: David Cook, Argonne National Laboratory

There are no open engineering tasks related to the TWR instrument suite.

3.6 Microwave Radiometers

Microwave Radiometer (MWR)

Mentor: Maria Cadeddu, Argonne National Laboratory

The MWR provides microwave radiances (expressed as “brightness temperatures”) obtained in the range of 23.8 and 31.4 GHz.

There are no open engineering tasks related to the MWR instrument suite.

Next-Generation Microwave Radiometer 3-Channel System (MWR3C)

Mentor: Maria Cadeddu, Argonne National Laboratory

The MWR provides microwave radiances (expressed as “brightness temperatures”) obtained in the range of 22 to 30 and 90 GHz.

Engineering Change Order ECO-00664, *Next-Generation MWR Procurement/Deployment*, is approved for action. The ARM Working Groups and Science and Infrastructure Steering Committee (previously known as the ARM Science Team Executive Committee) have approved the competitive procurement of next-generation 3-channel microwave radiometers (MWR3Cs). The systems are specified to provide three channels operating at 23, 31, and 90 GHz. The strategy is to replace the current aging MWRs with systems that broaden ARM's measurement performance parameters and provide an economic product life

cycle for the future. A procurement specification is in development based on the outcomes of the November 2007 “ACRF MWR Futures” workshop. The contract for the MWR3C was awarded to Radiometrics Corporation. A preliminary design review was conducted at the Radiometrics facility in Boulder, CO. Component availability for the 89 GHz receiver is causing some delay in the build and integration of the instrument. The pan-tilt positioner has been received and is being integrated in the design. The software is almost complete; the RF deck, lenses, and antenna systems are completed. The enclosure required for the IRT is ready for integration, and rain mitigation subsystem design will continue as final dimensions are finalized. The first systems were delivered to the SGP during September 2009. Inter-comparison testing is ongoing, and the initial review of the data looks good. Five units were installed on June 29–30, 2010. The units are currently operating and undergoing evaluation. The mentor is working with the vendor (Radiometrics) to resolve a high temperature bias (relative to model data and the legacy MWR).

High-Frequency Microwave Radiometer (MWRHF)

Mentor: Maria Cadeddu, Argonne National Laboratory

The MWRHF provides microwave radiances (expressed as “brightness temperatures”) obtained in the range of 90–150 GHz.

There are no open engineering tasks related to the MWRHF instrument suite.

NOTE: The two high-frequency microwave radiometers (MWRHFs) are new instruments from Radiometer Physics GmbH that are still under testing.

Microwave Radiometer Profiler (MWRP)

Mentor: Maria Cadeddu, Argonne National Laboratory

The MWRP provides microwave radiances (expressed as “brightness temperatures”) obtained at twelve frequencies in the range of 22–30 GHz (K-band) and 51–59 GHz (V-band).

There are no open engineering tasks related to the MWRP instrument suite from Radiometrics.

Microwave Radiometer, G-Band (183.3 GHz) Water Vapor Radiometer (GVR)

Mentor: Maria Cadeddu, Argonne National Laboratory

The GVR provides microwave radiances (expressed as “brightness temperatures”) obtained in the range of 183.3 GHz.

There are no open engineering tasks related to the G-band (183 GHz) Vapor Radiometer (GVR) instrument suite from ProSensing Inc.

NOTE: There is also a G-band (183 GHz) Vapor Radiometer Profiler (GVRP) radiometer developed by Radiometrics under the U.S. DOE Small Business Innovative Research (SBIR) program. This system is also known as the MP183. The GVRP has 15 channels between 170 GHz and 183.31 GHz. This system has not completed the ARM baseline processes.

3.7 Radars

Millimeter-Wavelength Cloud Radar (35 GHz) (MMCR)

Mentors: Kevin Widener, Pacific Northwest National Laboratory; Karen Johnson, Brookhaven National Laboratory

Engineering Change Order ECO-00551, *Refurbish Millimeter Wave Cloud Radar Antennas*, was begun in 2007, and over a 3-year period, the MMCR antennas will be refurbished and characterized on an antenna range. The spare antenna is complete, and the contract for the new feed and subreflector has been placed. Once these are completed, they will be installed on the antenna reflector and calibrated. The Barrow MMCR antenna will be refurbished first to avoid impacting planned field campaigns at SGP. Contract negotiations are in process for new antennas with a new contractor. For FY2008, two antennas with engineering and fabrication costs are approved for procurement and installation at the SGP and TWP sites. The SGP antenna is 10 ft in diameter, while antennas used at ARM's tropical sites are 6 ft in diameter. Two additional antennas are planned for FY2009 to support upgrades to ARM's TWP sites. The first two antennas (6 ft) are about to be delivered from Millitech, Inc. The first will replace the 10-ft antenna while it is being evaluated for refurbishment at Millitech. If it is "refurbishable," it will get a new feed, subreflector, and radome and won't be gone too long from the site. If not, Millitech will build a new antenna, which will take considerably longer (~6-7 months). Either way, once a good 10-ft antenna is back, it will be reinstalled, and the 6-ft antenna currently being used at SGP will be forwarded to Darwin. Antennas were damaged in route to the SGP and are being returned to the vendor, Millitech, for re-characterization. Turnaround time is estimated to be 3 weeks for the 6-ft antennas. When the 10-ft antenna is sent for refurbishment or new manufacture, the turnaround time will be approximately 4–5 months for refurbishment or approximately 6–8 months if a new antenna is built. The Darwin MMCR had its new antenna installed (January 28, 2010). The last 6-ft antenna has been received at ProSensing. The 10-ft antenna is delayed due to equipment problems at the antenna range. [The shipping date is now November 2010.](#)

Engineering Change Order ECO-00420, *Software I/Q Balancing on MMCRs*, was approved to remedy a problem with balance of the MMCR I and Q channels. This slight imbalance makes spectral analysis very difficult under certain conditions. Radar data provided by the site scientist office at NSA are being analyzed to evaluate software fixes. Millitech has determined that their antenna test range will not be able to handle the 10-ft antenna for characterization. They found two other test ranges (Air Force) that are available for rent. However, this increases the cost of characterization from ~\$7K to ~\$40K.

Kevin Widener surveyed a select group from the ARM Radar Group, and the consensus is that we should keep a 10-ft antenna at SGP and buy a new one without characterizing the old antenna. We placed a new contract with Millitech for a new 10-ft antenna and a 6-ft antenna. The two 6-ft antennas were sent to Manus and Darwin for installation at those sites.

W-Band (95-GHz) ARM Cloud Radar (WACR)

Mentor: Kevin Widener, Pacific Northwest National Laboratory

Engineering Change Order ECO-00681, *SWACR: Sampling Strategy, Software, Products*, is approved and assigned to Pavlos Kollias to define scanning strategies, the operational modes, and the value-added products (VAP) that the SWACR is envisioned to produce. The final statement of work with Pavlos Kollias is in place.

Engineering Change Order ECO-00391, *Millimeter Wave Cloud Radar Spectra Processing*, proposes an evaluation of the feasibility of implementing data reduction algorithms at each MMCR and WACR installation and shipping the resulting files to the ARM Data Archive via the Internet. A version of this software is in the release process to test ECO-00391 and ECO-00575. Implementation is underway and documented in BCR-1349, *Install WACR_Spec_Filter in Production*.

Radar Wind Profiler – 915, 1290 MHz (RWP)

Mentor: Rich Coulter, Argonne National Laboratory

There are no open engineering tasks related to the 915- and 1290-MHz Radar Wind Profilers (RWPs) instrument suite.

3.8 Radiometric Measurements, Broadband

Broadband Radiometer Station (BRS, SIRS, SKYRAD, GNDRAD, BSRN)

Mentor: Tom Stoffel, National Renewable Energy Laboratory

Engineering Change Request ECO-00781, *Establish Pyrgeometer Calibrations Traceable to the WISG*, is in approved to update the calibration technique for Precision Infrared Radiometers (PIR) (Pyrgeometers). Tom Stoffel is the engineering lead. The purpose of this ECR is to implement a new pyrgeometer calibration scheme as described in the work: “Stoffel T, I Reda, J Hickey, E Dutton, and J Michalsky. 2006: Pyrgeometer calibrations for the ARM Program - updated approach (Presented at Sixteenth Atmospheric Radiation Measurement (ARM) Science Team Meeting. Albuquerque, NM).” Based on discussions during the ASR Science Team Meeting, held in March 2010, the Broadband Radiometry instrument focus group, chaired by Chuck Long, has provided an update to the ECO outlining recommendations.

Narrow Field-of-View (NFOV) Radiometer

Mentor: Gary Hodges, NOAA/ESRL/GMD

There are no open engineering tasks related to the Narrow Field-of-View (NFOV) instrument suite.

Infrared Thermometer (IRT)

Mentor: Vic Morris, Pacific Northwest National Laboratory

Engineering Change Order ECO-00616, *Install IRTs in Ventilated Enclosures*, is in process to update our IRT enclosures. In implementing ECO-00345, *Install Zenith-Pointing IRT Network at SGP*, a HEPA-filtered, ventilated enclosure for the IRTs was designed that keeps debris and, incidentally, most rain, off the gold mirror and IRT lens. This enhancement is being implemented on the TWP and NSA IRT instruments. Vic Morris is leading this ECO. Danny Nelson, Jeff Zirzow, and Krzysztof are tasked under Morris’s direction to provide designs for SGP, NSA, and TWP respectively. Morris has recommended an enclosure solution for TWP; details are available within the ECO.

Engineering Change Order ECO-00368, *Increase Sample Rate of Infrared Thermometers*, is in process to increase the IRT sampling rate to 5 Hz. All systems are functioning except Nauru (see EWO-12288, *Update IRT Data Acquisition Software*). Communications latency issues are being resolved with the RocketPorts and fiber optic line drivers that are resulting in data collection problems.

3.9 Radiometric Measurements, Spectral

Atmospherically Emitted Radiance Interferometer (AERI)

Mentor: Dave Turner, Space Science and Engineering Center, University of Wisconsin

There are no open engineering tasks related to the Atmospherically Emitted Radiance Interferometer (AERI) instrument suite.

Cimel Sun Photometer (CSPOT)

Mentor: None (external data provided by NASA AERONET). Laurie Gregory, Brookhaven National Laboratory, is the infrastructure contact.

There are no open engineering tasks related to the Cimel Sun Photometer (CSPOT) instrument suite.

Multifilter Rotating Shadowband Radiometer and Related Systems (MFRSR, MFR)

Mentor: Gary Hodges, NOAA/ESRL/GMD

Engineering Change Order ECO-00659, *Add Two MFRs to the AMF Instrument Suite*, was entered to guide and document the addition of upwelling MFRs to the AMF. Gary Hodges is the leader. The first radiometer will be installed and verified during the AMF Azores experiment in FY2009, even though surface albedo at the AMF main site will not be representative of the local scale due to the dominant effects of the surrounding sea surface. A second upwelling MFR is proposed for addition to the AMF supplemental site during FY2010; a spare MFR head will be purchased then. Components are available, and the tower details are being finalized.

Engineering Change Request ECR-00688, *Add Functionality for MFRSR Campbell System at Latitudes > 50 deg*, submitted by Gary Hodges is approved for a FY2010 implementation. This revision to the MFRSR logger software will provide the capability of the MFRSRs to operate at latitudes greater than 50° latitude. Also, there are ongoing discussions related to an enhancement of the shadowband positioning to enable higher quality retrievals of aerosol optical depth. Also, the need to expand the memory of the MFRSR data logger is under consideration to extend buffering capabilities when communication to data collectors is not available.

Engineering Change Order ECO-00692, *Purchase Data Loggers and Heater Controllers for MFRSRs*, is approved and assigned to Gary Hodges. The task is to build and/or procure the spares necessary to support all ARM MFRSRs/MFRs. Components are on order.

Rotating Shadowband Spectrometer (RSS)

Mentor: Peter Kiedron, NOAA/ESRL/GMD

There are no open engineering tasks related to the Rotating Shadow-band Spectrometer (RSS) instrument suite.

Shortwave Spectrometer (SWS)

Mentor: Connor Flynn, Pacific Northwest National Laboratory

There are no open engineering tasks related to the Shortwave Spectrometer (SWS) instrument suite.

3.10 Precipitation and Rain

Disdrometer (DISDROMETER)

Mentor: Mary Jane Bartholomew, Brookhaven National Laboratory

There are no open engineering tasks related to the disdrometer instrument suite.

Optical Rain Gauge SGP (ORG)

Mentor: Mary Jane Bartholomew, Brookhaven National Laboratory

There are no open engineering tasks related to the Optical Rain Gauge (ORG) SGP instrument suite.

NOTE: There are also ORGs installed on the TWP and AMF metrological towers. Mike Ritsche is the mentor for these systems.

Total Precipitation Sensor NSA (TPS)

Mentors: Mark Ivey, Sandia National Laboratory; Jessie Cherry, International Arctic Research Center and Institute of Northern Engineering, University of Alaska Fairbanks

Engineering Change Order ECO-00773, *Improvements to Total Precipitation Infrastructure at the NSA*, is approved and assigned to Jesse Cherry. This provides an upgrade to the communications system for the Total Precipitation Sensor at Barrow. Currently the system depends on a wireless connection to both transmit and record the data. This ECO provides the addition of a data logger so that it can record the data even when the transmission system is disabled. The objective is to reduce the amount of data lost.

3.11 Sky Imaging

Total Sky Imager (TSI)

Mentor: Vic Morris, Pacific Northwest National Laboratory

Engineering Change Order ECO-00674, *Tasks Associated with TSI Camera and Software Upgrade*, is approved for implementation to provide an upgraded camera for the Total Sky Imager (TSI). This ECO is approved with a hold pending the design review to ensure that cost and overall impacts are reasonable. Power plug adaptors were made, the remaining cameras were procured, and the enclosures were assembled. The spare TSI from the AMF was received, and the process of determining the baseline clear-sky color image mapping for each camera began. Three of the cameras with enclosures and mounting hardware were delivered to Darwin. [The TSI camera and software were replaced at the TWP Nauru site on September 16, 2010.](#)

Engineering Change Order ECO-00644, *Subcontract to Upgrade TSI Software*, was approved to upgrade the TSI software to allow use of new versions of the Axis camera. Concepts to incorporate the packaging and mechanical design of the new version of the Axis camera will be covered in a new ECR. Progress continues: five of the six tasks are now completed. The final task to refine clear-sky reference images and seasonal azimuth angles is ongoing.

Engineering Change Order ECO-00625, *Upgrade TSI Control Boards*, was approved and is in process to update the control boards of the TSI-880 systems. This update will reconcile issues with the real-time clock and power supplies. The subcontract has been placed with Remote Measurement & Research Company (RMRCo), and the repairs and testing are successfully complete—two boards were repaired and eight additional boards are being fabricated for spares.

3.12 Surface Fluxes

Eddy Correlation Station (ECOR)

Mentor: David Cook, Argonne National Laboratory

There are no open engineering tasks related to the ECOR instrument suite.

Energy Balance Bowen Ratio (EBBR) Station

Mentor: David Cook, Argonne National Laboratory

There are no open engineering tasks related to the EBBR instrument suite.

Soil Water and Temperature System (SWATS)

Mentor: Daniel Hartsock, University of Oklahoma

The soil water and temperature system (SWATS), deployed at the SGP site, is designed to provide information about the temperature of the soil and the status of water in the soil profile. Because the SWATS array is aging, the sensor arrays are undergoing a replacement program.

Engineering Change Order ECO-00493, *Replace Failing SWATS Sensors*, is in process to add new redundant sensor arrays that will be installed at all SGP extended facility sites. These will be installed in a phased manner: five sites per year over four years, beginning in 2005 with the sites having multiple failed sensors given highest priority. After the soil recovers from the installation process in 6–12 months, the new sensor array will be connected to the existing SWATS data acquisition system in place of the old sensor array. Sensor arrays for FY2009 from Campbell Scientific have arrived at the SGP and are calibrated and ready for installation. Daniel Hartsock has prepared a status report on the SWATS refurbishment, which is attached to ECO-00493. Baseline Change Request BCR-01508, *Implement New Calibration Coefficients for sgpswats*, is complete. The new sensors at E19 were hooked up on December 11, 2008, and the ingest has been turned back on at both sites. Data now look good for all three SWATS refurbishments. Currently, ARM is waiting for the new extended facility sites to begin installation so the new sensors can be installed there for the SWATS profiles.

4.0 Future Instrumentation Planning

The instrument planning activities of the ARM Climate Research Facility are dynamic processes driven by the unmet measurement needs of contributing scientists, maintenance, calibration, simulation fidelity, and performance improvement/evolution of instrument and measurement systems. The spatial and temporal configurations of ARM's instrument systems and associated research sites are reviewed against science/measurement needs—these are important discussions and provide input to future instrument planning. Instrument plan recommendations and priorities are deliberated by the ASR science working groups and vetted thorough the ARM Infrastructure Management Board for action.

Please contact Jimmy Voyles at jimmy.voyles@pnl.gov for additional information related to ARM instrument planning.

5.0 Small Business Innovation Research

The U.S. DOE Small Business Innovative Research (SBIR) web page is available at <http://www.er.doe.gov/sbir/>. The DOE SBIR program develops instrumentation that can be applied to the science and measurement objectives of the ARM Climate Research Facility.
