

# **Use of Long Time-Series ACRF Measurements to Improve Data Quality Analysis**

**Sean Moore**  
**Mission Research and Technical Services**  
**Santa Barbara, CA**

**ARM Data Quality Office**  
**University of Oklahoma**  
**Norman, OK**

# ARM Data Quality Office

## Full Time Staff

- Ken Kehoe
- Randy Peppler
- Karen Sonntag
- Justin Monroe

## Student Analysts

- Nathan Hiers (Sr)
- Stephen Mullens (Sr)
- Kimberly Rabon (Jr)
- Lacey Evans (Jr)

*ARM Data Quality Office, National Weather Center  
The University of Oklahoma, Norman, OK*

*Sean Moore*

*Mission Research and Technical Services  
Santa Barbara, CA*

# Daily Quality Checks

- Automated software checks every measurement for outliers against some pre-defined limits.
- Suspicious data are flagged
- Statistics are collected regarding how often and when data are flagged
- Diagnostic plots are generated
- Analysts review metrics and plots

## ARM STatistical Analysis and Reporting System

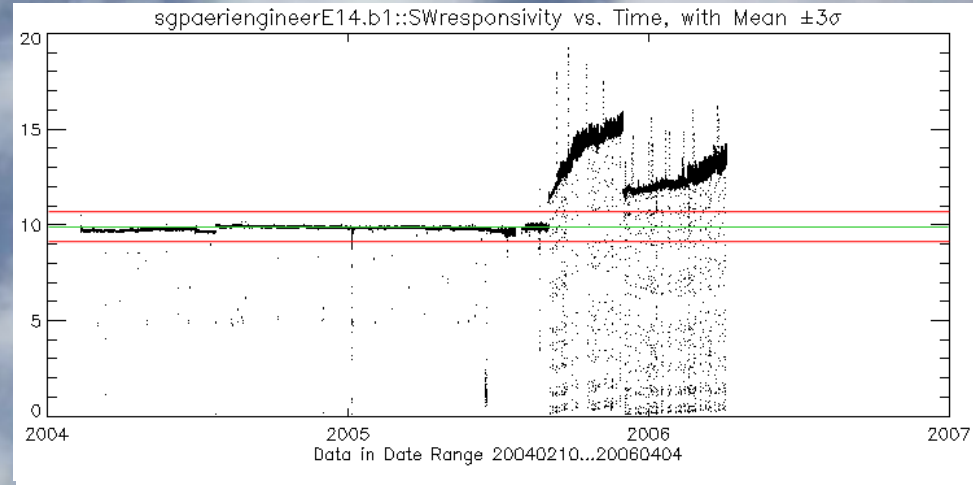

- Combines data from many months, years or decades
- Computes statistics over custom time ranges
- Produces long-term plots
- Frequency Distributions
- Feedback loop with analysts to refine results
- New limits in a database

# Determining New Limits

- Review historical data to decide on appropriate limits
- Detect instrument problems before problems affect primary measurements.
- Multimodal frequency distribution shows abrupt changes that warrant investigation

# Example: Improve QC Limits

- SMOS b-level NetCDF files define valid rh range as -2 to 104%
- Frequency distribution plot helps to identify problems (spike on left)
- Analysis suggests existing range may be too broad.

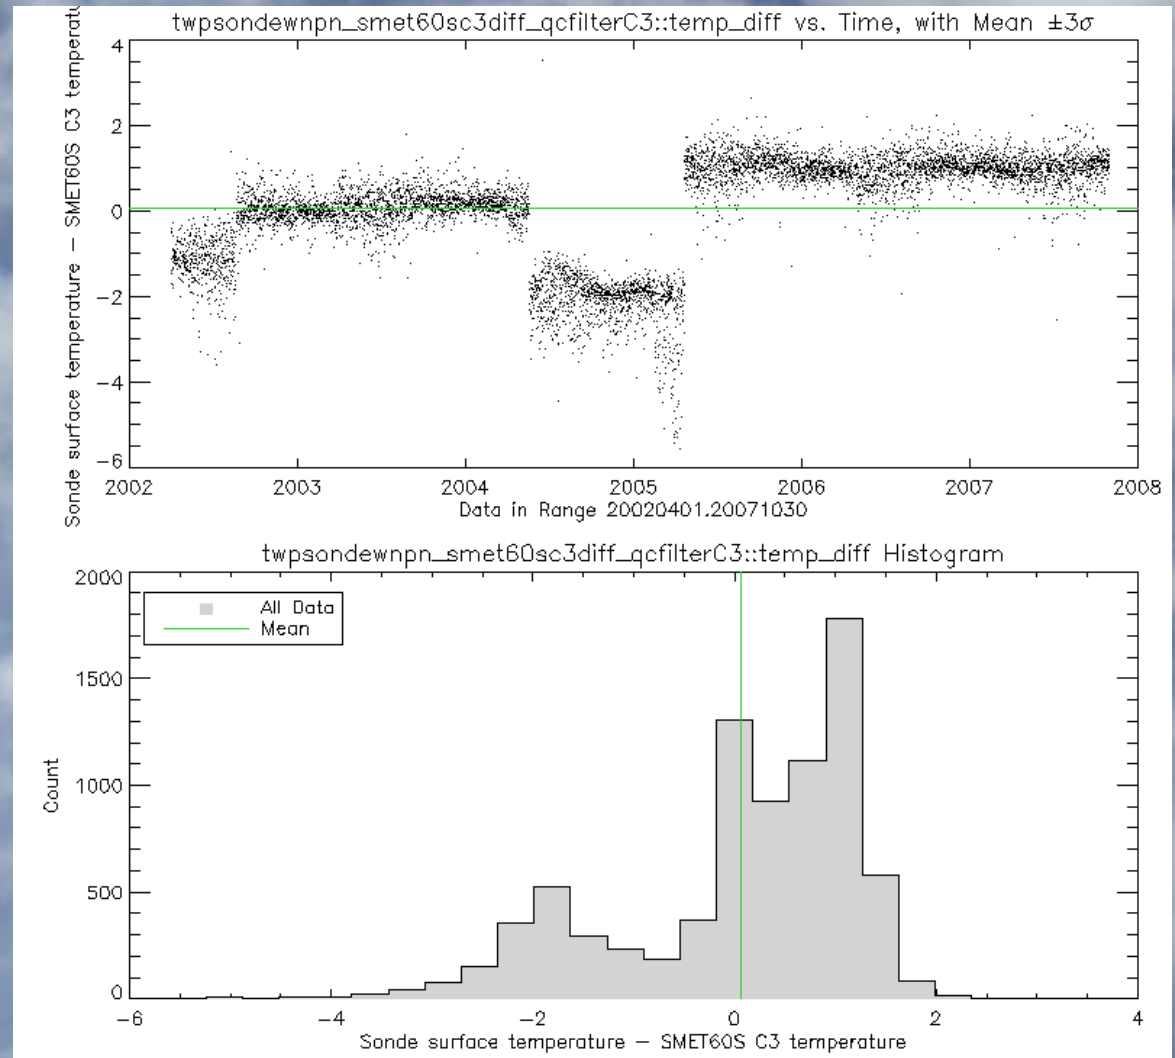

# Example: Monthly Limits

- No limits defined in NetCDF files for BEFLUX VAP
- Quickly assess typical behavior with plot
- Frequency distribution shows monthly data range distinct from overall range (January colored green)
- Analysis suggests monthly varying limits may be appropriate for data

# Instrument Comparisons

- Compare instruments to detect subtle problems
- Difference of Sonde surface temperature and SMET temperature
- 6 years of data
- Multiple issues discovered and resolved after this analysis

# Summary

- Statistics from historical data are useful to set or improve data quality range limits used by our automated metrics software.
- Long time-series plots useful to visually detect trends and instrument degradation problems.
- Historical distributions are useful visual aids to compare current data to typical data.
- These techniques are being implemented to improve ACRF data quality analysis!
