1.0 Data Availability

1.1 Description

Individual datastreams from instrumentation at the Atmospheric Radiation Measurement (ARM) Climate Research Facility fixed and mobile research sites are collected and routed to the Data Management Facility (DMF) for processing in near-real-time. Instrument and processed data are then delivered approximately daily to the ARM Data Archive, where they are made freely available to the research community. For each instrument, ARM calculates the ratio of the actual number of processed data records received daily at the Data Archive to the expected number of data records. The results are tabulated by 1) individual datastream, site, and month for the current year, and 2) site and fiscal year dating back to 1998.

The U.S. Department of Energy requires national user facilities to report time-based operating data. The requirements involve the:

- actual hours of operation (ACTUAL) – 24 hours per day, **92** days or **2208** hours for this quarter
- estimated maximum operation or uptime target (TARGET)
- variance (VARIANCE), which is equal to $(1 - [\text{ACTUAL}/\text{TARGET}])$
- the TARGET and VARIANCE numbers account for unplanned downtime.

For this reporting period the TARGET uptimes for the fixed ARM research sites were:

- North Slope of Alaska (NSA) locale is **1987.2** hours (0.90 x ACTUAL)
- Southern Great Plains (SGP) locale is **2097.6** hours (0.95 x ACTUAL)
- Tropical Western Pacific (TWP) locale is **1876.8** hours (0.85 x ACTUAL).

The SGP locale has a spatial dimension of 150 km x 150 km, including the Central Facility, five extended facilities, eight new surface characterization facilities, four radar facilities, and three profiler facilities sited within the domain. The NSA locale has the Barrow site. The TWP locale includes the Manus and Darwin sites.

The first ARM Mobile Facility (AMF1) is deployed in Brazil to participate in the GreenOceanAmazon (GOAMAZON) field campaign, which begins in January 2014. The GOAMAZON field campaign is a 2-year deployment scheduled to end December 31, 2015.

The second ARM Mobile Facility (AMF2) is deployed in Finland for the Biogenic Aerosols – Effects on Clouds and Climate (BAECC) field campaign. The BAECC field campaign operation begins February 2014 and is scheduled to end in December 2014. Upon completion of BAECC the AMF2 will be relocated to California to conduct the ARM Cloud Aerosol Precipitation Experiment (ACAPEX) field campaign during calendar year 2015. AMF2 is also approved to conduct the ARM West Antarctic Radiation Experiment (AWARE) campaign in Antarctica, scheduled to begin in late 2015 for the calendar year 2016.

Also, ARM began operating a third ARM Mobile Facility (AMF3), located at Oliktok Point, Alaska, and a fixed facility located in the Eastern North Atlantic (ENA), Graciosa Island, Azores. These sites are in the second phase of their build-plans and are expected to be fully operational in early fiscal year 2015.

The differences in TARGET performance reflect the complexity of local logistics and the frequency of extreme weather events. It is impractical to measure TARGET for each instrument or datastream. Data availability reported here refers to the average of the individual, continuous datastreams that have been received by the Data Archive. Therefore, data availability is directly related to individual instrument uptime expressed in hours. Data not at the Data Archive are caused by downtime (scheduled or unplanned) of the individual instruments. Missing data due to scheduled downtime are not included in the metrics. Thus, the average percentage of data in the Data Archive represents the average percentage of the time the instruments were operating this quarter.

1.2 Summary

Table 1 shows the accumulated maximum operation time (planned uptime), actual hours of operation, and variance (unplanned downtime) for the fixed sites. Because the mobile facilities operate episodically, the AMF statistics are reported separately and not included in the aggregate average with the fixed sites. The average of the fixed sites failed to meet the goal this quarter. This is because the satellite network communication system on Manus Island failed in December, thereby preventing collected measurements from being delivered to the ARM Data Archive. The repair of the Manus Island satellite network is scheduled for January 2014 and the data product delivery processes will catch up after that.

Table 1. Operational statistics for the fixed ARM sites and mobile facilities for this reporting period.*

| Site | Hours Of Operation | | | Data Availability | |
|---------------------|--------------------|---------------|---------------|-------------------|---------------|
| | Target | Actual | Variance | Goal | Actual |
| ENA | | | | | |
| NSA | 1987.2 | 2031.36 | -0.0222 | 90.00% | 92.00% |
| SGP | 2097.6 | 2075.52 | 0.0105 | 95.00% | 94.00% |
| TWP | 1876.8 | 1744.32 | 0.0706 | 85.00% | 79.00% |
| Site Average | 1987.2 | 1950.4 | 0.0185 | 90.00% | 88.33% |

*The ARM mobile facilities and aerial facility are not included in the operational baseline as the function intermittently. The new site in the Azores is not yet operating at baseline levels.

2.0 Scientific Users

2.1 Description

Users can participate in field experiments at the sites and mobile facilities, or they can participate remotely. Therefore, there are a variety of mechanisms provided to users to access site information. The Site Access Request System is a web-based database used to track visitors to the fixed and mobile sites, all of which have facilities that can be visited. Users who have immediate (real-time) needs for data access can request a research account on the local site data systems. This access is particularly useful to users for quick decisions in executing time-dependent activities associated with field campaigns at the

fixed site and mobile facility locations. The eight computers for the research accounts are located at the Barrow site; SGP Central Facility; TWP Manus, Nauru, and Darwin sites; AMFs; and DMF. However, users are warned that data provided at the time of collection are not fully screened for quality and therefore are not considered to be official ARM data. Hence, these accounts are considered to be part of the facility activities associated with field campaign activities, and users are tracked. Fully screened and approved ARM data are officially requested through the ARM Data Archive.

In addition, users that visit sites can connect their computer or instrument to an ARM site data system network, which requires an on-site device account. Remote (off-site) users can also have remote access to any ARM instrument or computer system at any ARM site, which requires an off-site device account. These accounts are also managed and tracked.

Official ARM data collected through the routine operations and scientific field experiments at the fixed sites and mobile facility that have passed through the formal data quality review process are stored at and distributed through the Data Archive. The Data Archive receives fully quality-assured data within 24–48 hours of the collection and processing of data that takes place at the DMF. These data are available to the public free of charge.

The U.S. Department of Energy requires national user facilities to report facility use by total visitor days—broken down by institution type, gender, race, citizenship, visitor role, visit purpose, and facility—for actual visitors and for active user research computer and Data Archive accounts. This information is maintained but not presented in this report. Visitor role and visit purpose information are peer-reviewed to identify scientific users.

Scientific users¹ are defined as members of the scientific community and infrastructure who are using the ARM Facilities or data to perform peer-reviewed science and research. For the ARM Infrastructure, this includes the scientists and engineers who are involved in the development of synthesis products, value-added products, instrument performance analysis, and uncertainty quantification.

This quarterly report provides the number of unique scientific users. All user accounts are established for a period of up to one year and must be renewed. **Unique scientific users** are defined as a single use of an ARM Facility's **on-site** assets, **off-site** services, or **data** services during the defined reporting period.

¹ Beginning in FY2013, the approach used to count scientific users for the ARM Climate Research Facility was revised to align with other DOE Office of Science user facilities. Please contact Jimmy Voyles at jimmy.voyles@pnl.gov with any questions related to the information presented here about the facility statistics.

2.2 Summary

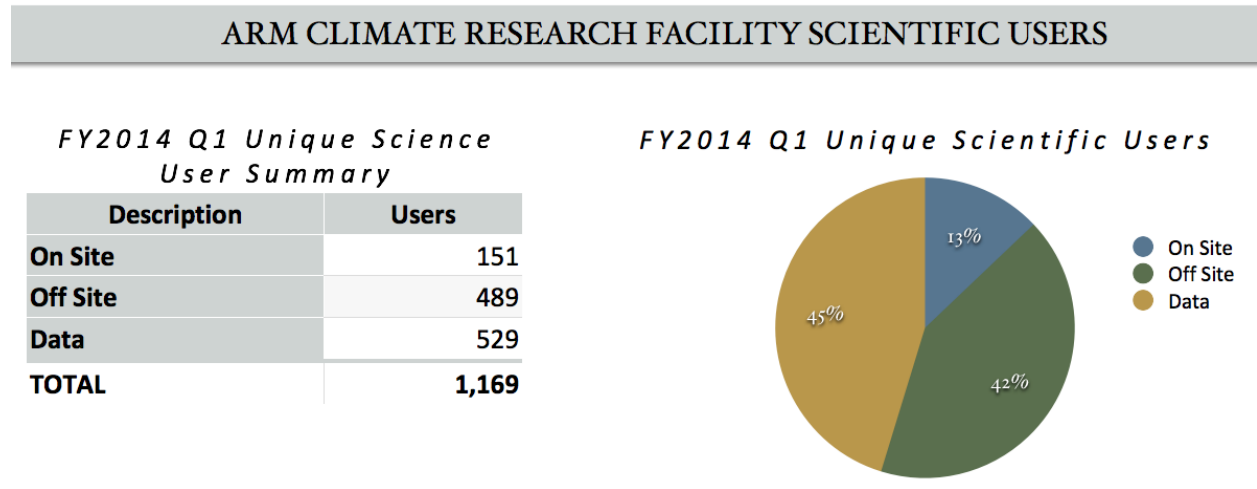

Figure 1. Shows the summary of unique scientific users for the previous 12 months.

3.0 Safety

For reporting purposes, the fixed ARM sites and the mobile facilities operate 24 hours per day, 7 days per week, and 52 weeks per year. Time is reported in days instead of hours. If any lost work time is incurred by any employee, it is counted as a workday loss. Table 2 reports the consecutive days since the last recordable or reportable injury or incident causing damage to property, equipment, or vehicles for this reporting period. There were no recordable lost workday cases or reportable injury or incidents causing damage to property, equipment, or vehicles reported.

Table 2. Consecutive days of injury-free* operation, for this reporting period.

| Environmental Safety and Health Category | NSA | SGP | TWP | AMF1 | AMF2 |
|---|-----|-----|-----|------|------|
| Days Worked Without a Lost-Time Incident | 92 | 92 | 92 | 92 | 92 |
| Days Worked Without a Recordable Accident | 92 | 92 | 92 | 92 | 92 |
| Days Worked Without a Property Damage Incident | 92 | 92 | 92 | 92 | 92 |
| Days Worked Without a Reportable Loss to Vehicles | 92 | 92 | 92 | 92 | 92 |
| **“Injury-free” is defined as days without a recordable lost-time incident or property damage incident. | | | | | |
